This thesis is the result of four years work in the Physics of Fluids group of Prof. Detlef Lohse at the University of Twente, and partly at the University of Patras with Prof. Ko van der Weele.

Vertically shaken granular matter shows very attractive collective phenomena (see the pictures on this cover), which are studied in this thesis by a combination of experiments, numerical simulations and theoretical analysis.

# Conclusie

Hydrodynamische modellen beschrijven met succes de effecten die in vertikaal geschudde granulaire materie waar te nemen zijn.

Belangrijke stap richting een beschrijving van granulaire materialen in het algemeen.

**Veel plezier!**
